Education Data

Research question

**

Data collection

We use the complete educational institutions dataset from the State Statistics Service of Ukraine, covering 2019–2025. The raw dataset contains 26,575 rows, 23 columns and 38 indicators covering several levels of education.

Variables collected

After checking regional and temporal coverage, we selected 19 indicators covering pre-school, general secondary, vocational, professional pretertiary and tertiary education. The main variables describe the number of students or pupils, institutions, enrolments, graduates, pre-school places and employees. These variables represent both participation in education and changes in educational infrastructure.

Quantitative description

After preprocessing, the regional dataset contains 25 regions, 7 years and 19 indicators, corresponding to 3,325 region-year-indicator observations. There are 3,124 available values and 201 missing values (6.05%). We also created a wide version with 175 region-year observations and 19 education variables, which will later be merged with the conflict and socioeconomic data.

Preprocessing and choices

The raw indicators have different breakdowns, such as terrain type, educational degree and staff position. We therefore used indicator-specific filters to keep one comparable total observation per region. The national total for Ukraine was kept separately, while Crimea and Sevastopol were excluded because the main indicators are systematically missing. Other missing values were kept as missing and were not replaced by zero.

Indicators with less consistent regional coverage or less direct relevance to our question, such as foreign students and postgraduate education, were not included in the core dataset.
